

GAINLite | Tackling the Integration Challenge

GAIN Data Management as Light Version

Josef Sommeregger | Head of Business Development, AIM Software

In the last years a gradual transition of the market for reference data has become more and more evident. Driven by more sophisticated data needs as well as the quest to curtail back office costs clients have started to re-evaluate existing data provider arrangements. As a result the sector has seen an unprecedented number of both data feed replacement projects as well as projects in which second or third data sources are integrated to cover specific data needs.

- Packaged version of GAIN Data Management platform
- Restricted to one feed
- Restricted to one target application

Changing back office landscapes

Apart from the looming changes in the area of reference data sourcing the entire back office related IT landscape is subjected to considerable changes: On the one hand a growing number of end-of-lifecycle back office solutions are waiting to be fed with more and more data or to even be replaced by more modern, future proof systems. On the other hand in house development is on the decline for a variety of factors, mainly the costs and risks of future maintenance.

Integrated with more than 15 commercial data feeds and interfaced to a majority of the leading back office systems GAINLite can be deployed in a quick and cost-effective manner.

The integration challenge

Against this background the technical and financial challenge is to map new data feed structures onto the APIs of new back office environments while the whole process needs to be fully automated in order to keep costs and operational risks at bay.

The solution: GAINLite Package

Drawing upon nearly 10 years of experience in the area of reference data integration the European market leader AIM Software has recently introduced a basic version of its flagship reference data management platform which is tailored to the immediate integration needs of

data feed customers and which can be easily packaged and integrated with existing back office applications.

GAINLite enables institutions to process messages of a multitude of the world's leading back-office data feeds in an automated way. By applying some minor restrictions the GAINLite package offers the following features at unprecedented low rates:

- The import of data from one data feed provider
- The automatic processing of this data
- The final export, and hence the mapping of this data, to one target back office system.

Integrated with more than 15 commercial data feeds and interfaced to a majority of the leading back office systems GAINLite can be deployed in a quick and cost-effective manner.

Utilizing the long term experience of AIM Software with the integration and automation of data feeds you can concentrate on your core competency. ■

- Unprecedented low rates for entry level reference data management solution
- Option to migrate to a full scale GAIN installation if the customer's needs grow
- GAINLite can also be offered in ASP mode
